

Solicitation Browser

Overview

Every weekday, the U.S. Defense Logistics Agency posts hundreds of new Requests for Quotation (RFQs) to DIBBS, the Defense Internet Bid Board System, at dibbs.bsm.dla.mil/RFQ. Each one is a public solicitation a vendor can bid on, usually for a specific part identified by an NSN (National Stock Number).

That's a lot of opportunities — but browsing DIBBS today is painful. Vendors need a fast, focused way to scan recent RFQs and find the ones worth quoting on.

That's where you come in. Your task is to build a tool that pulls daily DIBBS solicitations and lets a vendor browse, search, and filter them with ease.

This is an open-ended problem with no single “correct” solution. We want to see how you think, how you approach an unfamiliar challenge, and how you make tradeoffs under time constraints.

The Challenge

Build it your way. Choose your own tech stack, architecture, and approach. Create a full-stack web application where users can:

1. Pull data from `dibbs.bsm.dla.mil` — at minimum the **solicitation number** and **NSN** for each RFQ. More fields are welcome.
2. Browse the solicitations as a list or table.
3. **Search** across the solicitations.
4. **Filter** them — pick filters that make sense for someone evaluating opportunities.
5. Open each row back on its original page on DIBBS.

What We're Looking For

- **UX, stability, and speed** — does it feel good to use?
- **Filter choices** — which filters you picked, and why.
- **Problem-solving** — your thought process in arriving at the solution.
- **Product sense** — whether it looks like something a vendor would actually want to use.

Stack

Your choice. Pick what gets you to a polished result quickly.

You can absolutely use AI tools (Cursor, Claude Code, Codex, whatever). We care about the product you ship and the calls you made, not whether you typed every line yourself.

Deliverable

Push your code to a Git repository and share the link with us. Be ready to give a short demo of your solution and walk us through your approach — we value out of the box thinking and creativity.

Time

You have a few hours for this assignment. This is about rapid prototyping, not production-ready code. A working MVP that shows your problem-solving approach is far more valuable than a polished but incomplete solution. Don't get stuck on perfection — show us how you think.
